Data from the U.S. *Centers for Disease Control and Prevention* (CDC) has revealed that Wuhan coronavirus (COVID-19) vaccines could [reduce the lifespan of vaccinated men by at least 24 years](#).

The CDC data also revealed that the damage to health caused by each vaccine dose does not lessen over time. Instead, it continues indefinitely.

The CDC All-Cause Mortality data has shown that each vaccine dose increased mortality by seven percent in the year 2022 compared to the mortality in the year 2021. The data revealed that every year, every vaccinated person becomes more and more likely to die at a rate of seven percent per dose per year. This means COVID-19 vaccines and booster shots are a "slow-acting genetic poison."

It also shows that the human body cannot recover from any amount of mRNA injection falsely called "vaccines." (Related: [First COVID-19 lockdown in the UK shortened life expectancy of heart attack patients by NEARLY TWO YEARS.](#))

Data suggests vaccines are a "slow-acting genetic poison"

Data on [COVID-19 infection rates for the first 98 days](#) from Sept. 12, 2022, was taken when the bivalent vaccine was first offered to Cleveland Clinic employees. Note that the vaccine was not mandated but offered.

On that same day, 6,199 employees were unvaccinated, 2,359 received a single dose of the COVID-19 vaccine, 13,804 were double vaccinated, 20,798 received three doses, while at least 3,538 received at least four or five doses of the original vaccine.

However, the vaccine was designed against the Wuhan Hu1 reference virus, which wasn't isolated from a human but generated on a computer.

The results of the study revealed that the more doses of the original vaccine a person took, the more likely they were to catch COVID-19 – suggesting that the original coronavirus vaccine is not only ineffective against omicron but also anti-effective.

Data also shows that the vaccine doesn't work against the present strain of COVID-19. It can damage a person's immune system in a dose-dependent manner. This means the more doses that people receive, the more damage it will do to their immune systems.

Vaccine effects are a long-term problem

If people were recovering from the first COVID-19 vaccine dose, then it would not have the same effect as the fifth dose, which is equivalent to a seven percent increase in mortality.

This is a long-term problem because people are not recovering from the damage done by the shots in terms of excess mortality.

With 2021 as the baseline, a person who received five doses of the vaccine would be 350 percent more likely to die by 2031, 700 percent more likely to die by 2041 and 1,050 percent more likely to die by 2051 than an unvaccinated person.

Using this result, researchers calculate the loss in life expectancy for a 30-year-old male.

The life expectancy of a 30-year-old unvaccinated male in the United Kingdom is around 80 years. Meaning, a man in his 30s in the U.K. can expect another 50 years of life. But the life expectancy of a 30-year-old in the U.K. who has taken five doses of the COVID-19 vaccine is only 56 years. Such is the risk people take if they believe in [COVID-19 vaccines](#).
